HACKSECURE 2025

NULL VIT BHOPAL STUDENT CHAPTER

Title

- Problem Statement – Anti-India Campaign Detection on Digital Platforms
- Team Name - Binary_Brains⭐
- Batch - 2024 Batch

Team Member Details

	Name	Year	Registration Number	Mail Id	Mobile No
1.	Anisha Garg	2nd Year	24BAI10375	anisha.24bai10375@vitbhopal.ac.in	9058229922
2.	Vedant Mishra	2nd Year	24BCE10779	vedant.24bce10779@vitbhopal.ac.in	7565842406

Idea

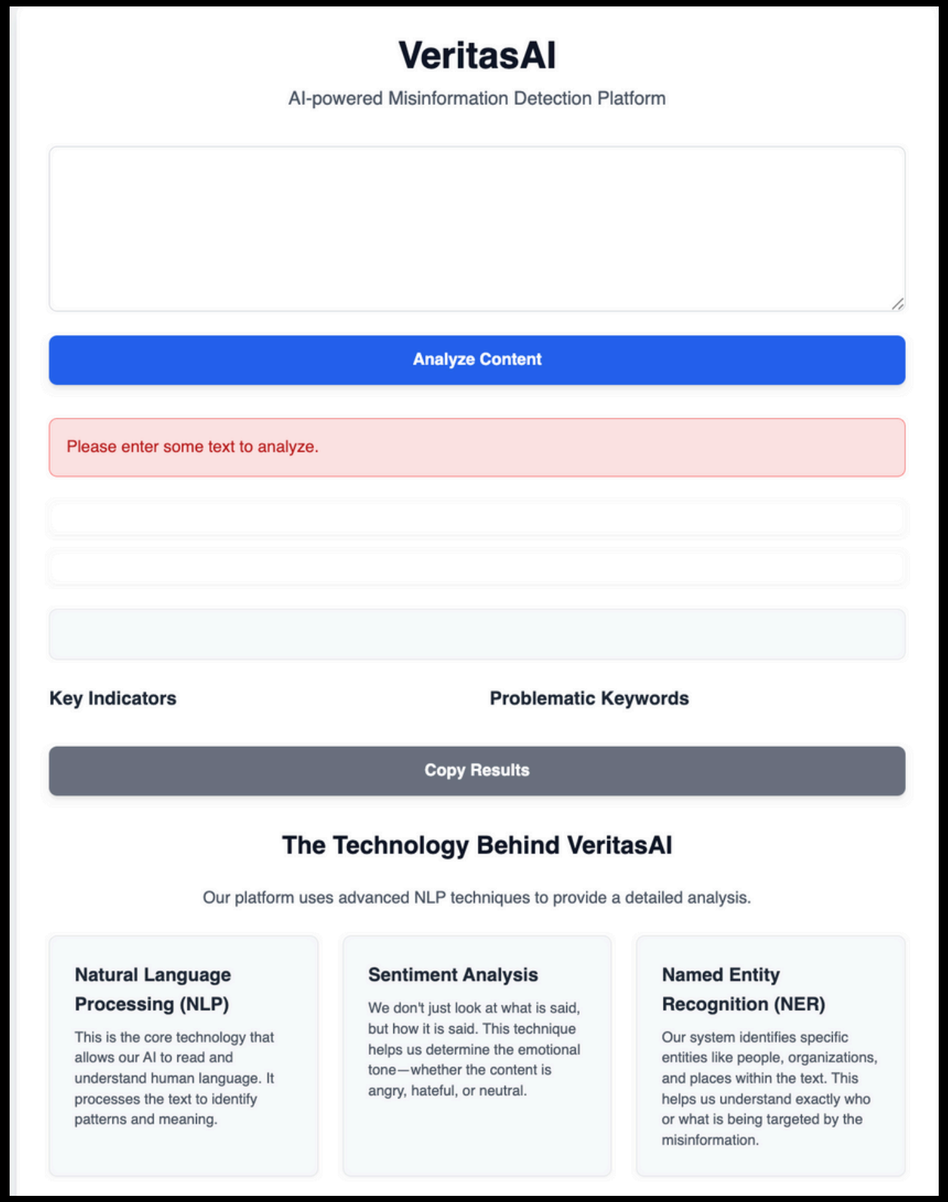

- What it is: We built VeritasAI, a smart tool that uses AI to spot fake news and hate speech.
- How it works: You give it a piece of text—like a social media post. Our AI looks at the words, the feeling behind them, and even the hashtags to figure out if it's a real threat.
- Why it's special: Unlike other tools, our platform doesn't just say "yes" or "no." It gives a full explanation. It tells you why something is flagged and shows you the key words and signs of a coordinated attack.

Technical Approach

- Frontend (what you see): We used a single HTML. It's clean, simple, and can be shown on any web browser. We used Tailwind CSS to make it look good.
- Backend (the brain): We built a backend server using Python and Flask. It's the engine that handles all the heavy lifting.
- AI Model: We used the Gemini API. We trained it to give us a specific, structured answer in JSON format, which helps us show all the details of the analysis.

Methodology and process for implementation

- Step 1: User Input. A user pastes content into the web app.
- Step 2: Frontend to Backend. The web app sends the text to our Flask server.
- Step 3: AI Analysis. The Flask server sends the text to the Gemini AI model, which analyzes it and returns a structured report.
- Step 4: Data Display. The web app receives the report and shows a clear breakdown of the analysis, including the threat level and key indicators.

Feasibility And Viability

- Feasible: We can build this. We used existing, well-tested technologies like Flask and the Gemini API. This saves time and allows us to focus on our specific problem.

Risks:

- Scalability: A large-scale version would need to handle a huge number of requests to the AI API.
- Data Access: Getting a continuous feed of data from social media platforms is a known challenge.

Solutions:

- For the hackathon: Our current prototype proves the concept.
- For the future: We could use a smart system to manage API requests and explore partnerships for data access.

Impact and Benefits

- For the Public: Our solution helps people identify fake news and propaganda. It empowers them to be more critical thinkers and reduces the risk of being manipulated by misinformation.

- For Authorities: We give government and security agencies a powerful tool for early threat detection. By providing a detailed analysis, we help them understand and respond to misinformation campaigns faster and more effectively.

- Scalability: The platform is designed to handle millions of posts and comments, making it a viable solution for large-scale digital platforms.

- Proactive vs. Reactive: This tool is proactive. Instead of reacting to a crisis after a false story goes viral, VeritasAI helps identify threats as they emerge, providing a crucial advantage in the fight against misinformation

Research and References

Our project is built on well-established and open-source technologies. We have relied on the following resources:

- Gemini API Documentation: This is the core of our AI analysis. We used the official documentation to understand the generateContent endpoint and how to structure our requests for a reliable, structured JSON output.
    - Link: https://ai.google.dev/docs/gemini_api_overview
- Flask Framework: The lightweight and flexible Python web framework that powers our backend server.
    - Link: https://flask.palletsprojects.com/
- Tailwind CSS: The utility-first CSS framework used to build our responsive and modern frontend design.
    - Link: https://tailwindcss.com/docs
- Python requests Library: A standard Python library for making HTTP requests to external APIs, which our backend uses to communicate with the Gemini API.
    - Link: https://requests.readthedocs.io/en/latest/

Deeper Impact

We believe our solution has benefits that go beyond the technical.

- Social Benefit: In an age of digital distrust, our tool helps verify information, fostering a more informed and engaged public. By giving people the ability to distinguish between genuine opinions and targeted misinformation, we can help build a healthier online environment.

- Economic Benefit: Misinformation can cause real economic damage, from manipulating stock prices to spreading false information about businesses. VeritasAI can serve as an early warning system, helping to protect our economy from these unseen threats.

- National Security: Our project is a direct response to a national security threat. We're providing a scalable, efficient method to detect foreign-backed propaganda and coordinated disinformation campaigns, ultimately helping to protect national interest and public stability.

Thanks
